

M1 Cybersecurity - Research Project

Advanced Software Analysis

Mohamed Sabt

Mohamed.sabt@irisa.fr

Given the proven effectiveness of LLM in various domains, for example to cheat in M1 projects, we are motivated to explore their potential applications for code analysis. This study aims to examine how LLMs can be leveraged to break code obfuscation. The primary goal of this project is to provide an empirical assessment of LLM-based Ghidra plugins on their effectiveness in breaking obfuscation.

The project involves 3 main steps:

- Identifying several obfuscators that we want to study.
- Construct a matrix to assess their resilience against an LLM-based Ghidra,
- Reverse engineer a real-world obfuscated code
